# A Type-Theoretic Reconstruction of DRT

# A Type-Theoretic Reconstruction of DRT

## Motivation:

- to formalize DRT within Church's simple theory of type (aka, Higher-Order Logic), which will allow DRT and Montague semantics to rest on the same logical foundations.

# A Type-Theoretic Reconstruction of DRT

## Motivation:

- to formalize DRT within Church's simple theory of type (aka, Higher-Order Logic), which will allow DRT and Montague semantics to rest on the same logical foundations.

## Challenge:

- to express dynamics using “static” primitives (in particular, to avoid the “destructive assignment” problem, which necessitates a LISP-like *gensym* operator).

# A Type-Theoretic Reconstruction of DRT

## Motivation:

- to formalize DRT within Church's simple theory of type (aka, Higher-Order Logic), which will allow DRT and Montague semantics to rest on the same logical foundations.

## Challenge:

- to express dynamics using “static” primitives (in particular, to avoid the “destructive assignment” problem, which necessitates a LISP-like *gensym* operator).

## Proposed solution:

- to interpret a sentence according to both its left and right contexts;
- to abstract these two kinds of contexts over the meaning of the sentences.

## Typing the left and the right contexts

## Typing the left and the right contexts

Montague semantics is based on Church's simple type theory, which provides a full hierarchy of functional types built upon two atomic types:

- $t$ , the type of individuals (a.k.a. entities).
- $o$ , the type of propositions (a.k.a. truth values).

## Typing the left and the right contexts

Montague semantics is based on Church's simple type theory, which provides a full hierarchy of functional types built upon two atomic types:

- $\iota$ , the type of individuals (a.k.a. entities).
- $o$ , the type of propositions (a.k.a. truth values).

We add a third atomic type,  $\gamma$ , which stands for the type of the left contexts.

## Typing the left and the right contexts

Montague semantics is based on Church's simple type theory, which provides a full hierarchy of functional types built upon two atomic types:

- $\iota$ , the type of individuals (a.k.a. entities).
- $o$ , the type of propositions (a.k.a. truth values).

We add a third atomic type,  $\gamma$ , which stands for the type of the left contexts.

What about the type of the right contexts?

## Typing the left and the right contexts

## Semantic interpretation of the sentences

## Semantic interpretation of the sentences

Let  $s$  be the syntactic category of sentences. Remember that we intend to abstract our notions of left and right contexts over the meaning of the sentences.

## Semantic interpretation of the sentences

Let  $s$  be the syntactic category of sentences. Remember that we intend to abstract our notions of left and right contexts over the meaning of the sentences.

$$\llbracket s \rrbracket = \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o$$

## Semantic interpretation of the sentences

Let  $s$  be the syntactic category of sentences. Remember that we intend to abstract our notions of left and right contexts over the meaning of the sentences.

$$\llbracket s \rrbracket = \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o$$

## Composition of two sentence interpretations

## Semantic interpretation of the sentences

Let  $s$  be the syntactic category of sentences. Remember that we intend to abstract our notions of left and right contexts over the meaning of the sentences.

$$\llbracket s \rrbracket = \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o$$

## Composition of two sentence interpretations

$$\llbracket S_1 . S_2 \rrbracket = \lambda e \phi . \llbracket S_1 \rrbracket e (\lambda e' . \llbracket S_2 \rrbracket e' \phi)$$

## Semantic interpretation of the syntactic categories

## Semantic interpretation of the syntactic categories

Montague's interpretation

$$\begin{aligned} \llbracket s \rrbracket &= o \\ \llbracket n \rrbracket &= \iota \rightarrow o \\ \llbracket np \rrbracket &= (\iota \rightarrow o) \rightarrow o \end{aligned}$$

## Semantic interpretation of the syntactic categories

Montague's interpretation

$$\begin{aligned} \llbracket s \rrbracket &= o \\ \llbracket n \rrbracket &= \iota \rightarrow o \\ \llbracket np \rrbracket &= (\iota \rightarrow o) \rightarrow o \end{aligned}$$

may be rephrased as follows:

$$\begin{aligned} \llbracket s \rrbracket &= o && (1) \\ \llbracket n \rrbracket &= \iota \rightarrow \llbracket s \rrbracket && (2) \\ \llbracket np \rrbracket &= (\iota \rightarrow \llbracket s \rrbracket) \rightarrow \llbracket s \rrbracket && (3) \end{aligned}$$

## Semantic interpretation of the syntactic categories

Montague's interpretation

$$\begin{aligned} \llbracket s \rrbracket &= o \\ \llbracket n \rrbracket &= \iota \rightarrow o \\ \llbracket np \rrbracket &= (\iota \rightarrow o) \rightarrow o \end{aligned}$$

may be rephrased as follows:

$$\begin{aligned} \llbracket s \rrbracket &= o & (1) \\ \llbracket n \rrbracket &= \iota \rightarrow \llbracket s \rrbracket & (2) \\ \llbracket np \rrbracket &= (\iota \rightarrow \llbracket s \rrbracket) \rightarrow \llbracket s \rrbracket & (3) \end{aligned}$$

Replacing (1) with:

$$\llbracket s \rrbracket = \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o$$

## Semantic interpretation of the syntactic categories

Montague's interpretation

$$\begin{aligned} \llbracket s \rrbracket &= o \\ \llbracket n \rrbracket &= \iota \rightarrow o \\ \llbracket np \rrbracket &= (\iota \rightarrow o) \rightarrow o \end{aligned}$$

may be rephrased as follows:

$$\begin{aligned} \llbracket s \rrbracket &= o & (1) \\ \llbracket n \rrbracket &= \iota \rightarrow \llbracket s \rrbracket & (2) \\ \llbracket np \rrbracket &= (\iota \rightarrow \llbracket s \rrbracket) \rightarrow \llbracket s \rrbracket & (3) \end{aligned}$$

Replacing (1) with:

$$\llbracket s \rrbracket = \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o$$

we obtain:

$$\begin{aligned} \llbracket n \rrbracket &= \iota \rightarrow \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o \\ \llbracket np \rrbracket &= (\iota \rightarrow \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o) \rightarrow \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o \end{aligned}$$

This interpretation results in handcrafted lexical semantics such as the following:

This interpretation results in handcrafted lexical semantics such as the following:

$$\begin{aligned}
 \llbracket \text{farmer} \rrbracket &= \lambda x e \phi. \mathbf{farmer} \ x \ \wedge \ \phi \ e \\
 \llbracket \text{donkey} \rrbracket &= \lambda x e \phi. \mathbf{donkey} \ x \ \wedge \ \phi \ e \\
 \llbracket \text{owns} \rrbracket &= \lambda o s. s \ (\lambda x. o \ (\lambda y e \phi. \mathbf{own} \ x \ y \ \wedge \ \phi \ e)) \\
 \llbracket \text{beats} \rrbracket &= \lambda o s. s \ (\lambda x. o \ (\lambda y e \phi. \mathbf{beat} \ x \ y \ \wedge \ \phi \ e)) \\
 \llbracket \text{who} \rrbracket &= \lambda r n x e \phi. n \ x \ e \ (\lambda e. r \ (\lambda \psi. \psi \ x) \ e \ \phi) \\
 \llbracket \text{a} \rrbracket &= \lambda n \psi e \phi. \exists x. n \ x \ e \ (\lambda e. \psi \ x \ (x :: e) \ \phi) \\
 \llbracket \text{every} \rrbracket &= \lambda n \psi e \phi. (\forall x. \neg (n \ x \ e \ (\lambda e. \neg (\psi \ x \ (x :: e) \ (\lambda e. \top)))))) \ \wedge \ \phi \ e \\
 \llbracket \text{it} \rrbracket &= \lambda \psi e \phi. \psi \ (\mathbf{sel} \ e) \ e \ \phi
 \end{aligned}$$

This interpretation results in handcrafted lexical semantics such as the following:

$$\begin{aligned}
 \llbracket \text{farmer} \rrbracket &= \lambda x e \phi. \mathbf{farmer} \ x \ \wedge \ \phi \ e \\
 \llbracket \text{donkey} \rrbracket &= \lambda x e \phi. \mathbf{donkey} \ x \ \wedge \ \phi \ e \\
 \llbracket \text{owns} \rrbracket &= \lambda o s. s \ (\lambda x. o \ (\lambda y e \phi. \mathbf{own} \ x \ y \ \wedge \ \phi \ e)) \\
 \llbracket \text{beats} \rrbracket &= \lambda o s. s \ (\lambda x. o \ (\lambda y e \phi. \mathbf{beat} \ x \ y \ \wedge \ \phi \ e)) \\
 \llbracket \text{who} \rrbracket &= \lambda r n x e \phi. n \ x \ e \ (\lambda e. r \ (\lambda \psi. \psi \ x) \ e \ \phi) \\
 \llbracket \text{a} \rrbracket &= \lambda n \psi e \phi. \exists x. n \ x \ e \ (\lambda e. \psi \ x \ (x :: e) \ \phi) \\
 \llbracket \text{every} \rrbracket &= \lambda n \psi e \phi. (\forall x. \neg (n \ x \ e \ (\lambda e. \neg (\psi \ x \ (x :: e) \ (\lambda e. \top)))))) \ \wedge \ \phi \ e \\
 \llbracket \text{it} \rrbracket &= \lambda \psi e \phi. \psi \ (\mathbf{sel} \ e) \ e \ \phi
 \end{aligned}$$

...which might seem a little bit involved.

**Questions:**

**Questions:**

- is there a systematic way of obtaining the new lexical semantics from Montague's?

**Questions:**

- is there a systematic way of obtaining the new lexical semantics from Montague's?
- can we find any “modular” presentation of the approach?

**Questions:**

- is there a systematic way of obtaining the new lexical semantics from Montague's?
- can we find any “modular” presentation of the approach?
- is there some dynamic logic hidden in the approach?

# A Type-Theoretic View of Dynamic Logic

## A Type-Theoretic View of Dynamic Logic

Let  $\Omega \triangleq \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o$ . We intend to design a logic acting on propositions of type  $\Omega$

## A Type-Theoretic View of Dynamic Logic

Let  $\Omega \triangleq \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o$ . We intend to design a logic acting on propositions of type  $\Omega$

We share with DRT the two following assumptions:

- discourse composition is mainly conjunctive (roughly speaking, a discourse consists in the conjunction of its sentences);
- the main form of quantification is existential (it introduces referential markers).

## A Type-Theoretic View of Dynamic Logic

Let  $\Omega \triangleq \gamma \rightarrow (\gamma \rightarrow o) \rightarrow o$ . We intend to design a logic acting on propositions of type  $\Omega$

We share with DRT the two following assumptions:

- discourse composition is mainly conjunctive (roughly speaking, a discourse consists in the conjunction of its sentences);
- the main form of quantification is existential (it introduces referential markers).

Consequently, our logic will be based on conjunction and existential quantification (defined as primitives). The other connectives will be obtained using negation (a third primitive) and de Morgan's laws.

## Formal Framework

We consider a simply-typed  $\lambda$ -calculus, the terms of which are built upon asigature including the following constants:

## Formal Framework

We consider a simply-typed  $\lambda$ -calculus, the terms of which are built upon asigature including the following constants:

### FIRST-ORDER LOGIC

$\top$	:	$o$		$(truth)$
$\neg$	:	$o \rightarrow o$		$(negation)$
$\wedge$	:	$o \rightarrow o \rightarrow o$		$(conjunction)$
$\exists$	:	$(\iota \rightarrow o) \rightarrow o$		$(existential\ quantification)$

## Formal Framework

We consider a simply-typed  $\lambda$ -calculus, the terms of which are built upon asigature including the following constants:

### FIRST-ORDER LOGIC

$\top$	:	$o$	( <i>truth</i> )
$\neg$	:	$o \rightarrow o$	( <i>negation</i> )
$\wedge$	:	$o \rightarrow o \rightarrow o$	( <i>conjunction</i> )
$\exists$	:	$(\iota \rightarrow o) \rightarrow o$	( <i>existential quantification</i> )

### DYNAMIC PRIMITIVES

$::$	:	$\iota \rightarrow \gamma \rightarrow \gamma$	( <i>context updating</i> )
<b>sel</b>	:	$\gamma \rightarrow \iota$	( <i>choice operator</i> )

## Conjunction

## Conjunction

Conjunction is nothing but sentence composition. We therefore define:

$$A \sqcap B \triangleq \lambda e \phi. A e (\lambda e. B e \phi)$$

## Conjunction

Conjunction is nothing but sentence composition. We therefore define:

$$A \sqcap B \triangleq \lambda e \phi. A e (\lambda e. B e \phi)$$

## Existential quantification

## Conjunction

Conjunction is nothing but sentence composition. We therefore define:

$$A \sqcap B \triangleq \lambda e \phi. A e (\lambda e. B e \phi)$$

## Existential quantification

Existential quantification introduces “reference markers”. It is therefore responsible for context updating:

$$\Sigma x. P x \triangleq \lambda e \phi. \exists x. P x (x::e) \phi$$

## Conjunction

Conjunction is nothing but sentence composition. We therefore define:

$$A \sqcap B \triangleq \lambda e \phi. A e (\lambda e. B e \phi)$$

## Existential quantification

Existential quantification introduces “reference markers”. It is therefore responsible for context updating:

$$\Sigma x. P x \triangleq \lambda e \phi. \exists x. P x (x::e) \phi$$

## Negation

## Conjunction

Conjunction is nothing but sentence composition. We therefore define:

$$A \sqcap B \triangleq \lambda e \phi. A e (\lambda e. B e \phi)$$

## Existential quantification

Existential quantification introduces “reference markers”. It is therefore responsible for context updating:

$$\Sigma x. P x \triangleq \lambda e \phi. \exists x. P x (x::e) \phi$$

## Negation

We do not want the continuation of the discourse to fall into the scope of the negation. Consequently, negation must be defined as follows:

$$\sim A \triangleq \lambda e \phi. \neg (A e (\lambda e. \top)) \wedge \phi e$$

## Implication and Universal Quantification

## Implication and Universal Quantification

These are defined using de Morgan's laws:

$$\begin{aligned} A \supset B &\triangleq \sim(A \sqcap \sim B) \\ \Pi x. P x &\triangleq \sim \Sigma x. \sim(P x) \end{aligned}$$

## Implication and Universal Quantification

These are defined using de Morgan's laws:

$$\begin{aligned} A \supset B &\triangleq \sim(A \sqcap \sim B) \\ \Pi x. P x &\triangleq \sim \Sigma x. \sim(P x) \end{aligned}$$

Embedding of first-order logic into dynamic logic

## Implication and Universal Quantification

These are defined using de Morgan's laws:

$$A \supset B \triangleq \sim(A \sqcap \sim B)$$

$$\Pi x. P x \triangleq \sim \Sigma x. \sim(P x)$$

## Embedding of first-order logic into dynamic logic

$$\overline{R t_1 \dots t_n} = \lambda e \phi. R t_1 \dots t_n \wedge \phi e$$

$$\overline{\neg A} = \sim \overline{A}$$

$$\overline{A \wedge B} = \overline{A} \sqcap \overline{B}$$

$$\overline{\exists x. A} = \Sigma x. \overline{A}$$

## Implication and Universal Quantification

These are defined using de Morgan's laws:

$$A \supset B \triangleq \sim(A \sqcap \sim B)$$

$$\Pi x. P x \triangleq \sim \Sigma x. \sim(P x)$$

## Embedding of first-order logic into dynamic logic

$$\overline{R t_1 \dots t_n} = \lambda e \phi. R t_1 \dots t_n \wedge \phi e$$

$$\overline{\neg A} = \sim \overline{A}$$

$$\overline{A \wedge B} = \overline{A} \sqcap \overline{B}$$

$$\overline{\exists x. A} = \Sigma x. \overline{A}$$

This embedding is such that, for every term  $e$  of type  $\gamma$ :

$$A \equiv \overline{A} e (\lambda e. \top)$$

# Donkey Sentence Revisited

## Donkey Sentence Revisited

Montague-like semantic interpretation:

[[farmer]]	=	<b>farmer</b>
[[donkey]]	=	<b>donkey</b>
[[owns]]	=	$\lambda OS. S (\lambda x. O (\lambda y. \mathbf{own} x y))$
[[beats]]	=	$\lambda OS. S (\lambda x. O (\lambda y. \mathbf{beat} x y))$
[[who]]	=	$\lambda RQx. Q x \wedge R (\lambda P. P x)$
[[a]]	=	$\lambda PQ. \exists x. P x \wedge Q x$
[[every]]	=	$\lambda PQ. \forall x. P x \supset Q x$
[[it]]	=	???

## Donkey Sentence Revisited

Montague-like semantic interpretation:

$$\begin{aligned}
 \llbracket \text{farmer} \rrbracket &= \mathbf{farmer} \\
 \llbracket \text{donkey} \rrbracket &= \mathbf{donkey} \\
 \llbracket \text{owns} \rrbracket &= \lambda OS. S (\lambda x. O (\lambda y. \mathbf{own} x y)) \\
 \llbracket \text{beats} \rrbracket &= \lambda OS. S (\lambda x. O (\lambda y. \mathbf{beat} x y)) \\
 \llbracket \text{who} \rrbracket &= \lambda RQx. Q x \wedge R (\lambda P. P x) \\
 \llbracket \text{a} \rrbracket &= \lambda PQ. \exists x. P x \wedge Q x \\
 \llbracket \text{every} \rrbracket &= \lambda PQ. \forall x. P x \supset Q x \\
 \llbracket \text{it} \rrbracket &= ???
 \end{aligned}$$

Dynamic interpretation:

$$\begin{aligned}
 \llbracket \text{farmer} \rrbracket &= \overline{\mathbf{farmer}} \\
 \llbracket \text{donkey} \rrbracket &= \overline{\mathbf{donkey}} \\
 \llbracket \text{owns} \rrbracket &= \lambda OS. S (\lambda x. O (\lambda y. \overline{\mathbf{own}} x y)) \\
 \llbracket \text{beats} \rrbracket &= \lambda OS. S (\lambda x. O (\lambda y. \mathbf{beat} x y)) \\
 \llbracket \text{who} \rrbracket &= \lambda RQx. Q x \sqcap R (\lambda P. P x) \\
 \llbracket \text{a} \rrbracket &= \lambda PQ. \Sigma x. P x \sqcap Q x \\
 \llbracket \text{every} \rrbracket &= \lambda PQ. \Pi x. P x \sqsupset Q x \\
 \llbracket \text{it} \rrbracket &= \lambda Pe\phi. P (\mathbf{sel} e) e \phi
 \end{aligned}$$

With the dynamic interpretation we have that:

$\llbracket \text{beats} \rrbracket \llbracket \text{it} \rrbracket (\llbracket \text{every} \rrbracket (\llbracket \text{who} \rrbracket (\llbracket \text{owns} \rrbracket (\llbracket \text{a} \rrbracket \llbracket \text{donkey} \rrbracket))) \llbracket \text{farmer} \rrbracket))$

With the dynamic interpretation we have that:

$$\llbracket \text{beats} \rrbracket \llbracket \text{it} \rrbracket (\llbracket \text{every} \rrbracket (\llbracket \text{who} \rrbracket (\llbracket \text{owns} \rrbracket (\llbracket \text{a} \rrbracket \llbracket \text{donkey} \rrbracket))) \llbracket \text{farmer} \rrbracket))$$

$\beta$ -reduces to the following term (modulo de Morgan's laws):

$$\lambda e \phi. (\forall x. \mathbf{farmer} \ x \supset (\forall y. \mathbf{donkey} \ y \supset (\mathbf{own} \ x \ y \supset \mathbf{beat} \ x \ (\text{sel} \ (x::y::e)))))) \wedge \phi \ e$$

With the dynamic interpretation we have that:

$$\llbracket \text{beats} \rrbracket \llbracket \text{it} \rrbracket (\llbracket \text{every} \rrbracket (\llbracket \text{who} \rrbracket (\llbracket \text{owns} \rrbracket (\llbracket \text{a} \rrbracket \llbracket \text{donkey} \rrbracket))) \llbracket \text{farmer} \rrbracket))$$

$\beta$ -reduces to the following term (modulo de Morgan's laws):

$$\lambda e \phi. (\forall x. \mathbf{farmer} x \supset (\forall y. \mathbf{donkey} y \supset (\mathbf{own} x y \supset \mathbf{beat} x (\mathbf{sel} (x::y::e)))))) \wedge \phi e$$

that is, assuming that **sel** is a “perfect” anaphora resolution operator:

$$\lambda e \phi. (\forall x. \mathbf{farmer} x \supset (\forall y. \mathbf{donkey} y \supset (\mathbf{own} x y \supset \mathbf{beat} x y))) \wedge \phi e$$

## Observations

## Observations

- Dynamic propositions are usually seen as contexts transformers.

## Observations

- Dynamic propositions are usually seen as contexts transformers.
- Here, we transform contexts  $(\gamma)$  into “type-raised” contexts  $((\gamma \rightarrow o) \rightarrow o)$ .

## Observations

- Dynamic propositions are usually seen as contexts transformers.
- Here, we transform contexts  $(\gamma)$  into “type-raised” contexts  $((\gamma \rightarrow o) \rightarrow o)$ .
- Interpreting  $(\gamma \rightarrow o) \rightarrow o$  as a double negation, we may identify it with  $\gamma$ .

## Observations

# Call by Value $\lambda\mu$ -calculus

# Call by Value $\lambda\mu$ -calculus

**syntax**

# Call by Value $\lambda\mu$ -calculus

## syntax

The set of  $\lambda\mu$ -terms is built upon two disjoint sets of variables (namely,  $\lambda$ -variables and  $\mu$ ) according to the following rules:

$T$	::=	$c$	(constant)
		$x$	( $\lambda$ -variable)
		$(\lambda x. T)$	( $\lambda$ -abstraction)
		$(T T)$	(application)
		$(\mu a. T)$	( $\mu$ -abstraction)
		$a(T)$	(naming)
		$\langle T \rangle$	(reset)

# Call by Value $\lambda\mu$ -calculus

## syntax

The set of  $\lambda\mu$ -terms is built upon two disjoint sets of variables (namely,  $\lambda$ -variables and  $\mu$ ) according to the following rules:

$T$	::=	$c$	(constant)
		$x$	( $\lambda$ -variable)
		$(\lambda x. T)$	( $\lambda$ -abstraction)
		$(T T)$	(application)
		$(\mu a. T)$	( $\mu$ -abstraction)
		$a(T)$	(naming)
		$\langle T \rangle$	(reset)

The set of values is defined as follows:

$$V ::= cV \dots V \mid x \mid \lambda x. T$$

## Intended operational meaning

## Intended operational meaning

$(\mu a. \dots a(t_1) \dots a(t_2) \dots a(t_n) \dots) \ u$

## Intended operational meaning

$$\underbrace{(\mu a. \dots a(t_1) \dots a(t_2) \dots a(t_n) \dots)}_{\alpha \rightarrow \beta} \quad u$$

## Intended operational meaning

$$\underbrace{(\mu a. \dots a(t_1) \dots a(t_2) \dots a(t_n) \dots)}_{\alpha \rightarrow \beta} \underbrace{u}_{\alpha}$$

### Intended operational meaning

$$(\underbrace{\mu a. \dots a(t_1) \dots a(t_2) \dots a(t_n) \dots}_{\alpha \rightarrow \beta}) \underbrace{u}_{\alpha}$$

### Intended operational meaning

$$(\mu a. \dots a(t_1) \dots a(t_2) \dots a(t_n) \dots) u$$

$$\rightarrow (\mu a. \dots a(t_1 u) \dots a(t_2 u) \dots a(t_n u) \dots)$$

### Intended operational meaning

$$\underbrace{(\mu a. \dots a(t_1) \dots a(t_2) \dots a(t_n) \dots)}_{\alpha \rightarrow \beta} \underbrace{u}_{\alpha}$$

$\alpha \rightarrow \beta$        $\alpha \rightarrow \beta$        $\alpha \rightarrow \beta$

$$\rightarrow (\mu a. \dots a(t_1 u) \dots a(t_2 u) \dots a(t_n u) \dots)$$

Symmetrically:

$$f(\mu a. \dots a(t_1) \dots a(t_2) \dots a(t_n) \dots) \rightarrow (\mu a. \dots a(f t_1) \dots a(f t_2) \dots a(f t_n) \dots)$$

# Dynamic Logic Revisited

# Dynamic Logic Revisited

## Conjunction

# Dynamic Logic Revisited

## Conjunction

Conjunction amounts to functional composition.

$$A \sqcap B \triangleq \lambda e. B(Ae)$$

# Dynamic Logic Revisited

## Conjunction

Conjunction amounts to functional composition.

$$A \sqcap B \triangleq \lambda e. B(Ae)$$

## Existential quantification

# Dynamic Logic Revisited

## Conjunction

Conjunction amounts to functional composition.

$$A \sqcap B \triangleq \lambda e. B (A e)$$

## Existential quantification

Existential quantification introduces “reference markers” by updating the context:

$$\Sigma x. P x \triangleq \lambda e. \mu c. \exists x. c (P x (x::e))$$

# Dynamic Logic Revisited

## Conjunction

Conjunction amounts to functional composition.

$$A \sqcap B \triangleq \lambda e. B (A e)$$

## Existential quantification

Existential quantification introduces “reference markers” by updating the context:

$$\Sigma x. P x \triangleq \lambda e. \mu c. \exists x. c (P x (x::e))$$

## Negation

# Dynamic Logic Revisited

## Conjunction

Conjunction amounts to functional composition.

$$A \sqcap B \triangleq \lambda e. B (A e)$$

## Existential quantification

Existential quantification introduces “reference markers” by updating the context:

$$\Sigma x. P x \triangleq \lambda e. \mu c. \exists x. c (P x (x::e))$$

## Negation

The scope of the negation must be restricted to the current proposition and, consequently, “reset” the continuation:

$$\sim A \triangleq \lambda e. \mu c. \neg(\text{READ } e A) \wedge c(e)$$

## Implication and Universal Quantification

## Implication and Universal Quantification

They could be defined using de Morgan's laws. Alternative (simpler) definitions are as follows:

## Implication and Universal Quantification

They could be defined using de Morgan's laws. Alternative (simpler) definitions are as follows:

$$A \supset B \triangleq \lambda e. \mu c. \neg \langle (\lambda e. \neg (\text{READ } e B)) (A e) \rangle \wedge c(e)$$

$$\Pi x. P x \triangleq \lambda e. \mu c. (\forall x. \text{READ } (x::e) (P x)) \wedge c(e)$$

# Donkey Sentence Again

## Donkey Sentence Again

The dynamic lexical semantics is kept unchanged:

[[farmer]]	=	$\overline{\text{farmer}}$
[[donkey]]	=	$\overline{\text{donkey}}$
[[owns]]	=	$\lambda OS. S (\lambda x. O (\lambda y. \overline{\text{own}} x y))$
[[beats]]	=	$\lambda OS. S (\lambda x. O (\lambda y. \overline{\text{beat}} x y))$
[[who]]	=	$\lambda RQx. Q x \sqcap R (\lambda P. P x)$
[[a]]	=	$\lambda PQ. \Sigma x. P x \sqcap Q x$
[[every]]	=	$\lambda PQ. \Pi x. P x \sqsupset Q x$
[[it]]	=	$\lambda Pe. P (\text{sel } e) e$

## Donkey Sentence Again

The dynamic lexical semantics is kept unchanged:

$$\begin{aligned}
 \llbracket \text{farmer} \rrbracket &= \overline{\text{farmer}} \\
 \llbracket \text{donkey} \rrbracket &= \overline{\text{donkey}} \\
 \llbracket \text{owns} \rrbracket &= \lambda OS. S (\lambda x. O (\lambda y. \overline{\text{own}} x y)) \\
 \llbracket \text{beats} \rrbracket &= \lambda OS. S (\lambda x. O (\lambda y. \overline{\text{beat}} x y)) \\
 \llbracket \text{who} \rrbracket &= \lambda RQx. Q x \sqcap R (\lambda P. P x) \\
 \llbracket \text{a} \rrbracket &= \lambda PQ. \Sigma x. P x \sqcap Q x \\
 \llbracket \text{every} \rrbracket &= \lambda PQ. \Pi x. P x \sqsupset Q x \\
 \llbracket \text{it} \rrbracket &= \lambda Pe. P (\text{sel } e) e
 \end{aligned}$$

Then, we have that:

$$\llbracket \text{beats} \rrbracket \llbracket \text{it} \rrbracket (\llbracket \text{every} \rrbracket (\llbracket \text{who} \rrbracket (\llbracket \text{owns} \rrbracket (\llbracket \text{a} \rrbracket \llbracket \text{donkey} \rrbracket))) \llbracket \text{farmer} \rrbracket))$$

## Donkey Sentence Again

The dynamic lexical semantics is kept unchanged:

$$\begin{aligned}
 \llbracket \text{farmer} \rrbracket &= \overline{\text{farmer}} \\
 \llbracket \text{donkey} \rrbracket &= \overline{\text{donkey}} \\
 \llbracket \text{owns} \rrbracket &= \lambda OS. S (\lambda x. O (\lambda y. \overline{\text{own}} x y)) \\
 \llbracket \text{beats} \rrbracket &= \lambda OS. S (\lambda x. O (\lambda y. \overline{\text{beat}} x y)) \\
 \llbracket \text{who} \rrbracket &= \lambda RQx. Q x \sqcap R (\lambda P. P x) \\
 \llbracket \text{a} \rrbracket &= \lambda PQ. \Sigma x. P x \sqcap Q x \\
 \llbracket \text{every} \rrbracket &= \lambda PQ. \Pi x. P x \sqsupset Q x \\
 \llbracket \text{it} \rrbracket &= \lambda Pe. P (\text{sel } e) e
 \end{aligned}$$

Then, we have that:

$$\llbracket \text{beats} \rrbracket \llbracket \text{it} \rrbracket (\llbracket \text{every} \rrbracket (\llbracket \text{who} \rrbracket (\llbracket \text{owns} \rrbracket (\llbracket \text{a} \rrbracket \llbracket \text{donkey} \rrbracket))) \llbracket \text{farmer} \rrbracket))$$

reduces to the following term :

$$\lambda e. \mu c. (\forall x. \text{farmer } x \supset (\forall y. \text{donkey } y \supset (\text{own } x y \supset \text{beat } x (\text{sel } (x::y::e)))))) \wedge c(e)$$

# Conclusions

## Conclusions

- The  $\lambda\mu$ -calculus allows propositions ( $\circ$ ) and contexts ( $\gamma$ ) to be mixed in a same term.

## Conclusions

- The  $\lambda\mu$ -calculus allows propositions ( $\circ$ ) and contexts ( $\gamma$ ) to be mixed in a same term.
- To this end, the use of the “reset” operator is central.

## Conclusions

- The  $\lambda\mu$ -calculus allows propositions ( $\circ$ ) and contexts ( $\gamma$ ) to be mixed in a same term.
- To this end, the use of the “reset” operator is central.
- The reset operator we have used is rather “cheap”.

## Conclusions

- The  $\lambda\mu$ -calculus allows propositions ( $\circ$ ) and contexts ( $\gamma$ ) to be mixed in a same term.
- To this end, the use of the “reset” operator is central.
- The reset operator we have used is rather “cheap”.
- More powerful versions (w.r.t. typing) should allow other dynamic phenomena (e.g. definite clauses, focus, presuppositions) to be handled similarly.
