What is Machine Translation?

Translation is the process of:

- moving texts from one (human) language (**source language**) to another (**target language**),
- in a way that preserves meaning.

Machine translation (MT) automates (part of) the process:

- Fully automatic translation
- Computer-aided (human) translation

What is MT good for?

- When you need the gist of something and there are no human translators around:
 - translating e-mails & webpages
 - obtaining information from sources in multiple languages (e.g., search engines)
- If you have a limited vocabulary and a small range of sentence types:
 - translating weather reports
 - translating technical manuals
 - translating terms in scientific meetings
 - determining if certain words or ideas appear in suspected terrorist documents → help pin down which documents need to be looked at closely
- If you want your human translators to focus on interesting/difficult sentences while avoiding lookup of unknown words and translation of mundane sentences.

Is MT needed?

- Translation is of immediate importance for multilingual countries (Canada, India, Switzerland, ...), international institutions (United Nations, International Monetary Fund, World Trade Organization, ...), multinational or exporting companies.
- The European Union used to have 11 official languages, since May 1, 2004 it has 20. All federal laws and other documents have to be translated into all languages.

What is MT not good for?

- Things that require subtle knowledge of the world and/or a high degree of (literary) skill:
 - translating Shakespeare into Navaho
 - diplomatic negotiations
 - court proceedings
 - ...
- Things that may be a life or death situation:
 - Pharmaceutical business
 - Automatically translating frantic 911 calls for a dispatcher who speaks only Spanish

Example translations

The simple case

- It will help to look at a few examples of real translation before talking about how a machine does it.
- Take the simple Spanish sentence and its English translation below:
 - Yo hablo español.
I speak_{1st.sg} Spanish
'I speak Spanish.'
- Words in this example pretty much translate one-for-one
- But we have to make sure *hablo* matches with *Yo*, i.e., that the subject agrees with the form of the verb.

What makes MT hard?
Evaluating MT systems
References

Example translations

A slightly more complex case

The order and number of words can differ:

- (2) a. Tu hablas español?
You speak_{2nd.sg} Spanish
Do you speak Spanish?*
- b. Hablas español?
Speak_{2nd.sg} Spanish
Do you speak Spanish?*

What goes into a translation

- Some things to note about these examples and thus what we might need to know to translate:
- Words have to be translated. → dictionaries
 - Words are grouped into meaningful units. (cf., our discussion of syntax for grammar checkers).
 - Word order can differ from language to language.
 - The forms of words within a sentence are systematic, e.g., verbs have to be conjugated, etc.

Direct transfer systems (cont.)

Language and Computers
Topic 5: Machine Translation

Introduction
Examples in Textbooks
Background: Dictionaries
Transformer approaches
Linguistic knowledge-based systems

- A direct transfer system has a **transfer component** which relates a source language representation with a target language representation.
- This can also be called a **comparative grammar**.
- We'll walk through the following French to English example:
 - (7) Londres plait à Sam.
London is pleasing to Sam
'Sam like London.'

Machine learning-based systems
Algebra

21/07

Steps in a transfer system

Language and Computers
Topic 5: Machine Translation

Introduction
Examples in Textbooks
Background: Dictionaries
Transformer approaches
Linguistic knowledge-based systems

- source language grammar analyzes the input and puts it into an **underlying representation** (UR).
Londres plait à Sam → Londres plaire Sam (source UR)
- The transfer component relates this source language UR (French UR) to a target language UR (English UR).

French UR English UR
 X plaire Y ↔ Eng(Y) like Eng(X)
 (where Eng(X) means the English translation of X)

Londres plaire Sam (source UR) → Sam like London (target UR)
- target language grammar translates the target language UR into an actual target language sentence.
Sam like London → Sam likes London.

Things to note about transfer systems

Language and Computers
Topic 5: Machine Translation

Introduction
Examples in Textbooks
Background: Dictionaries
Transformer approaches
Linguistic knowledge-based systems

- The transfer mechanism is essentially reversible; e.g., the *plaire* rule works in both directions (at least in theory)
- Because we have a separate target language grammar, we are able to ensure that the rules of English apply; *like* → *likes*.
- Word order is handled differently than with transformers: the URs are essentially unordered.
- The underlying representation can be of various levels of abstraction – words, syntactic trees, meaning representations, etc.; we will talk about this with the **translation triangle**.

Caveat about reversibility

Language and Computers
Topic 5: Machine Translation

Introduction
Examples in Textbooks
Background: Dictionaries
Transformer approaches
Linguistic knowledge-based systems

- It seems like reversible rules are highly desirable—and in general they are—but we may not always want reversible rules.
 - e.g., Dutch *aanvangen* should be translated into English as *begin*, but English *begin* should be translated into Dutch as *beginnen*.

Machine learning-based systems

Levels of abstraction

Language and Computers
Topic 5: Machine Translation

Introduction
Examples in Textbooks
Background: Dictionaries
Transformer approaches
Linguistic knowledge-based systems

- There are differing levels of abstraction at which transfer can take place. So far we have looked at URs that represent only word information.
- We can do a full syntactic analysis, which helps us to know how the words in a sentence relate.
- Or we can do only a partial syntactic analysis, such as representing the dependencies between words.

Czech-English example

Language and Computers
Topic 5: Machine Translation

Introduction
Examples in Textbooks
Background: Dictionaries
Transformer approaches
Linguistic knowledge-based systems

(8) Kaufman & Broad odmítla institucionální investory
Kaufman & Broad declined institutional investors
to name/identify
'Kaufman & Broad refused to name the institutional investors.'

Example taken from Čmejrek, Cuřín, and Havelka (2003).

- They find the base forms of words (e.g., *odmítout* 'to decline' instead of *odmítla* 'declined')
- They find which words depend on which other words and represent this in a tree (e.g., the noun *investory* depends on the verb *odmítla*)
- This dependency tree is then converted to English (comparative grammar) and re-ordered as appropriate.

- Ideally, we could use an **interlingua** = a language-independent representation of meaning.
- Benefit:** To add new languages to your MT system, you merely have to provide mapping rules between your language and the interlingua, and then you can translate into any other language in your system.
- What your interlingua looks like depends on your goals; an example for *I shot the sheriff*. is shown on the following slide.

- What exactly should be represented in the interlingua?
 - e.g., English *corner* = Spanish *rincón* = 'inside corner' or *esquina* = 'outside corner'
- A fine-grained interlingua can require extra (unnecessary) work:
 - e.g., Japanese distinguishes *older brother* from *younger brother*, so we have to disambiguate *English brother* to put it into the interlingua. Then, if we translate into French, we have to ignore the disambiguation and simply translate it as *frère*, which simply means 'brother'.

- Instead of trying to tell the MT system how we're going to translate, we might try a **machine learning** approach = the computer will learn how to translate based on example translations.
- For this, we need
 - examples of translations as **training data**, and
 - a way of learning from that data.

Using frequency (statistical methods)

- We can look at how often a source language word is translated as a target language word, i.e., the **frequency** of a given translation, and choose the most frequent translation.
- But how can we tell what a word is being translated as? There are two different cases:
 - We are told what each word is translated as: **text alignment**
 - We are not told what each word is translated as: use a **bag of words**

Text alignment

35/37

- With word alignments, it is relatively easy to calculate probabilities.
- e.g., What is the probability that *run* translates as *correr* in Spanish?
 - Count up how many times *run* appears in the English part of your bi-text. e.g., 500 times
 - Out of all those times, count up how many times it was translated as (i.e., aligns with) *correr*. e.g., 275 (out of 500) times.
 - Divide to get a probability: $275/500 = 0.55$, or 55%

- Knowing how words align in the training data will not tell us how to handle the new data we see.
 - we may have many cases where *fool* is aligned with the Spanish *engañan* = "to fool"
 - but we may then encounter a *fool*, where the translation should be *tonto* (male) or *tonta* (female)
- So, word alignment only helps us get some frequency numbers; we still have to do something intelligent with them.

- What if we're not given word alignments?
- How can we tell which English words are translated as which German words if we are only given an English text and a corresponding German text?
 - We can treat each sentence as a **bag of words** = unordered collection of words.
 - If word A appears in a sentence, then we will record all of the words in the corresponding sentence in the other language as appearing with it.

Example for bag of words method

Language and Computers

45/37

If we also have *He is nice/On simpatich'nyi*, then for *He*, we do the following:

- Count up the number of possible translation words: 4 from the first sentence, 2 from the second = 6 total.
- Count up the number of times *On* in the translation = 2 times out of 6 = $1/3 = 0.33$, or 33%.

Every other word has the probability $1/6 = 0.17$, or 17%, so *On* is clearly the best translation for *He*.

45/37

We've seen how MT systems can work, but MT is a very difficult task because languages are vastly different. They differ:

- Lexically: In the words they use
- Syntactically: In the constructions they allow
- Semantically: In the way meanings work
- Pragmatically: In what readers take from a sentence.

In addition, there is a good deal of real-world knowledge that goes into a translation.

<h2>Lexical ambiguity</h2> <p>Words can be lexically ambiguous = have multiple meanings.</p> <ul style="list-style-type: none"> ▶ <i>bank</i> can be a financial institution or a place along a river. ▶ <i>can</i> can be a cylindrical object, as well as the act of putting something into that cylinder (e.g., <i>John cans tuna</i>), as well as being a word like <i>must</i>, <i>might</i>, or <i>should</i>. <p>⇒ We have to know which meaning before we translate.</p>	<h2>How words divide up the world (lexical issues)</h2> <p>Words don't line up exactly between languages. Within a language, we have synonyms, hyponyms, and hypernyms.</p> <ul style="list-style-type: none"> ▶ <i>sofa</i> and <i>couch</i> are synonyms (mean the same thing) ▶ <i>sofa</i> is a hyponym (more specific term) of <i>furniture</i> ▶ <i>furniture</i> is a hypernym (more general term) of <i>sofa</i> 	<h2>Synonyms</h2> <p>Often we find synonyms between two languages (as much as there are synonyms within a language):</p> <ul style="list-style-type: none"> ▶ English <i>book</i> = Russian <i>kniga</i> ▶ English <i>music</i> = Spanish <i>música</i> <p>But words don't always line up exactly between languages.</p>
<h2>Hypernyms and Hyponyms</h2> <ul style="list-style-type: none"> ▶ English hypernyms = words that are more general in English than in their counterparts in other languages <ul style="list-style-type: none"> ▶ English <i>know</i> is rendered by the French <i>savoir</i> ('to know a fact') and <i>connaître</i> ('to know a thing') ▶ English <i>library</i> is German <i>Bücherei</i> if it is open to the public, but <i>Bibliothek</i> if it is intended for scholarly work. ▶ English hyponyms = words that are more specific in English than in their foreign language counterparts. <ul style="list-style-type: none"> ▶ The German word <i>Berg</i> can mean either <i>hill</i> or <i>mountain</i> in English. ▶ The Russian word <i>рука</i> can mean either <i>hand</i> or <i>arm</i>. 	<h2>Semantic overlap</h2> <p>And then there's just fuzziness, as in the following English and French correspondences</p> <ul style="list-style-type: none"> ▶ <i>leg</i> = <i>etape</i> (journey), <i>jambe</i> (human), <i>pied</i> (chair), <i>patte</i> (animal) ▶ <i>foot</i> = <i>pied</i> (human), <i>patte</i> (bird) ▶ <i>paw</i> = <i>patte</i> (animal) 	<h2>Venn diagram of semantic overlap</h2>
<h2>Lexical gaps</h2> <p>Sometimes there is no simple equivalent for a word in a language, and the word has to be translated with a more complex phrase. We call this a lexical gap or lexical hole.</p> <ul style="list-style-type: none"> ▶ French <i>gratiner</i> means something like 'to cook with a cheese coating' ▶ Hebrew <i>stam</i> means something like 'I'm just kidding' or 'Nothing special.' 	<h2>Light verbs</h2> <p>Some verbs carry little meaning, so-called light verbs</p> <ul style="list-style-type: none"> ▶ French <i>faire une promenade</i> is literally 'make a walk', but it has the meaning of the English <i>take a walk</i> ▶ Dutch <i>een poging doen</i> 'do an attempt' means the same as the English <i>make an attempt</i> 	<h2>Idioms</h2> <p>And often we face idioms = expressions whose meaning is not made up of the meanings of the individual words.</p> <ul style="list-style-type: none"> ▶ e.g., English <i>kick the bucket</i> <ul style="list-style-type: none"> ▶ approximately equivalent to the French <i>casser sa pipe</i> ('break his/her pipe') ▶ but we might want to translate it as <i>mourir</i> ('die') ▶ and we want to treat it differently than <i>kick the table</i>

<h3>Idiosyncrasies</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>55-57</p> <p>There are idiosyncratic choices among languages, e.g.:</p> <ul style="list-style-type: none"> English <i>heavy smoker</i> French <i>grand fumeur</i> (large smoker) German <i>starker Raucher</i> ('strong smoker') 	<h3>Taboo words</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>62-67</p> <p>There are taboo words = words which are "forbidden" in some way or in some circumstances (i.e., swear/course words)</p> <ul style="list-style-type: none"> You of course know several English examples. Note that the literal meanings of these words lack the emotive impact of the actual words. Other languages/cultures have different taboos: often revolving around death, body parts, bodily functions, disease, and religion. <ul style="list-style-type: none"> e.g., The word 'skin' is taboo in a Western Australian (Aboriginal) language (http://www.sjls.org.au/online/ICABerchbook/BerchbookChapters.pdf) Imagine encountering the word 'skin' in English and translating it without knowing this. 	<h3>Structure and word order differences</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>68-73</p> <ul style="list-style-type: none"> Word order (and syntactic structure) differs across languages. E.g., in English, we have what is called a subject-verb-object (SVO) order, as in (10). <p>(10) John punched Bill. SUBJECT VERB OBJECT</p> In contrast, Japanese is SOV, Arabic is VSO. Dyrbal (Australian aboriginal language) has free word order. MT systems have to account for these differences.
<h3>More on word order differences</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>80-87</p> <ul style="list-style-type: none"> Sometimes things are conceptualized differently in different languages, e.g.: <ol style="list-style-type: none"> His name is Jerome. Er heißt Jerome. (German) He goes-by-name-of Jerome Il s' appelle Jerome. (French) He himself call Jerome. Words don't really align here. 	<h3>How syntactic grouping and meaning relate (Syntax/Semantics)</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>88-97</p> <p>Even within a language, there are syntactic complications. We can have structural ambiguities = sentences where there are multiple ways of interpreting it.</p> <p>(12) John saw the boy (with the binoculars).</p> <p>with the binoculars can refer to either the boy or to how John saw the boy.</p> <ul style="list-style-type: none"> This difference in structure corresponds to a difference in what we think the sentence means, i.e., meaning is derived from the words and how they are grouped. Do we attempt to translate only one interpretation? Or do we try to preserve the ambiguity in the target language? 	<h3>How language is used (Pragmatics)</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>98-107</p> <p>Translation becomes even more difficult when we try to translate something in context.</p> <ul style="list-style-type: none"> Thank you is usually translated as <i>merci</i> in French, but it is translated as <i>'il vous plaît'</i> 'please' when responding to an offer. Can you drive a stick-shift? could be a request for you to drive my manual transmission automobile, or it could simply be a request for information about your driving abilities.
<h3>Real-world knowledge</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>108-117</p> <ul style="list-style-type: none"> Sometimes we have to use real-world knowledge to figure out what a sentence means. <p>(13) Put the paper in the printer. Then switch it on.</p> We know what it refers to only because we know that printers, not paper, can be switched on. 	<h3>Ambiguity resolution</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>118-127</p> <ul style="list-style-type: none"> If the source language involves ambiguous words/phrases, but the target language does not have the same ambiguity, we have to resolve ambiguity before translation. <p>e.g., the hyponyms/hypernyms we saw before.</p> Sometimes we might want to preserve the ambiguity, or note that there was ambiguity or that there are a whole range of meanings available. <p>⇒ In the Bible, the Greek word <i>hyper</i> is used in 1 Corinthians 15:29; it can mean 'over', 'for', 'on behalf of', and so on. How you treat it affects how you translate the theological issue of salvation of the already dead, i.e., people care deeply about how you translate this word, yet it is not entirely clear what English meaning it has.</p> 	<h3>Evaluating MT systems</h3> <p>Language and Computers Topic 5: Machine Translation</p> <p>Introduction Keywords to Remember Background: Dictionaries Transformer approaches Linguistic knowledge-based systems Data reader system Machine learning-based systems Algorithms</p> <p>What makes MT hard? Evaluating MT systems References</p> <p>128-137</p> <ul style="list-style-type: none"> We've seen some translation systems and we know that translation is hard. The question now is: How do we evaluate MT systems, in particular for use in large corporations as likely users? <ul style="list-style-type: none"> How much change in the current setup will the MT system force? <p>Translator tasks will change from translation to updating the MT dictionaries and post-editing the results.</p> How will it fit in with word processors and other software? <ul style="list-style-type: none"> Will the company selling the MT system be around in the next few years for support and updates? How fast is the MT system? How good is the MT system (quality)?

- **Intelligibility** = how understandable the output is
- **Accuracy** = how faithful the output is to the input
- **Error analysis** = how many errors we have to sort through (and how do the errors affect intelligibility & accuracy)
- **Test suite** = a set of sentences that our system should be able to handle

Intelligibility Scale (from Arnold et al., 1994)

1. The sentence is perfectly clear and intelligible. It is grammatical and reads like ordinary text.
2. The sentence is generally clear and intelligible. Despite some inaccuracies or infelicities of the sentence, one can understand (almost) immediately what it means.
3. The general idea of the sentence is intelligible only after considerable study. The sentence contains grammatical errors and/or poor word choices.
4. The sentence is unintelligible. Studying the meaning of the sentence is hopeless; even allowing for context, one feels that guessing would be too unreliable.

Some of the examples are adapted from the following books:

- Doug J. Arnold, Lorna Balkan, Siety Meijer, R. Lee Humphreys and Louisa Sadler (1994). *Machine Translation: an Introductory Guide*. Blackwells-NCC, London, 1994. Available from <http://www.essex.ac.uk/linguistics/clmt/MTbook/>
- Jurafsky, Daniel, and James H. Martin (2000). *Speech and Language Processing: An Introduction to Natural Language Processing, Speech Recognition, and Computational Linguistics*. Prentice-Hall. More info at <http://www.cs.colorado.edu/~martin/slp.html>.
